ABSTRACT OF THE DISCLOSURE

A subsurface wastewater infiltration system including a subsurface dripline enclosed within a porous medium or chamber providing storage volume around the dripline. The porous medium or chamber may be covered with a geotextile or filter material and sealed at dripline inlet and outlet to prevent soil intrusion. The chamber illustratively contains access openings to the ground surface allowing inspection and maintenance of the disposal system without excavation. The access openings provide air recirculation within the disposal system for proper operation and treatment of the effluent.
